Comparative Table: Ryanair vs. EasyJe

Aspect	Ryanair	EasyJet
Attributes	- Route map - destination name with pictures and prices - cheapest available date - one way or return option - journey dates - departure and arrival airport - passenger number selection - The destination on the map is indicated by a blue dot with a plane.	- Route map with orange dots indicating the departure airport. - Clicking on the dots allows users to see where they can fly from that airport.
Users' tasks	- Find the cheapest flights - compare prices - discover new destinations - buy tickets	- Find the cheapest prices - compare prices - discover new destinations - buy tickets
Marks and Channels	- Use of a map with marks for destinations - text and image for cities - size and text colour to highlight the prices	- A map with marks is used to indicate the departure airports - destination information is shown only after the interaction
Chromatic scheme	- Predominance of blue and white - prices are written in blue and are larger to attract attention - Blue is used in the map - Blue is the brand colour with yellow and white	- Neutral colours - map in light blue and white, orange dots (brand colour) and arrival airports in black.
Usability	- User-friendly - Easy to use - clicking on blue dots or on the cities list gives direct	- Less user-friendly - The information is not immediately available - the user must perform several

	access to ticket availability - The information is clear.	steps to obtain the details.

Focusing on task abstraction, Hibino (1999) highlighted that users' interactions on website platforms involve preparation, planning, exploration, presentation, overlay, and reorientation. Considering this, it is possible to affirm that the analyzed websites mostly support planning and exploration tasks.

Considering accessibility, Agrawal et al. (2019) analyzed airline websites and highlighted issues with color contrast, page structure, and navigation.

Ryanair's website focuses on immediacy and price visibility, allowing users to explore the site easily. However, this may create visual overload. While EasyJet adopts a cleaner and more consistent style, it requires more steps to access information.

Peer review (fiaz)

The text is clear and highlights all the requested points correctly. Interestingly, the observation on green is used to underline the lowest prices because it shows how the color can drive users' decision-making.

A particularly interesting aspect is that easyJet supports exploratory tasks, whereas Ryanair supports goal-oriented analytical tasks. As can be observed on both websites, Easyjet offers an interactive map that allows users to explore destinations and discover new routes. Instead, Ryanair is more focused on direct flight searches; the ability to filter by dates and prices makes it easy for users to find the most convenient travel option.

As supported by Zhoung et al. (2022), Ryanair's choice is user-centered and goal-oriented because the interface is based on users' goals and what they need to do. The authors state that the principal goal of the digital interface is to prioritize clear and structured navigation and allow easy access to the principal function.

Another interesting aspect is the navigation modes used by both websites. Ryanair uses a targeted navigation mode,whereas EasyJet uses a spatial navigation mode. Zong et al.
(2022) analyzed different types of navigation: structural, spatial, and targeted. Starting from spatial

navigation, it is possible to state that it follows the screen position, meaning that the user follows a logical structure as if it follows visualization coordination, while targeted navigation allows focusing on the specific element without having to remember the entire path.

In conclusion, comparing both websites allows us to highlight how navigation structure and interface design can influence the interaction of and that different design strategies support different users' needs.

Peer review II (Mattia)

Your comparison between the Ryanair and easyJet websites is very clear and well-organised. You correctly identified the main features, such as origin, destination, and prices. I agree with the distinction between the two types of activities offered by each platform. Ryanair focuses more on price-based options, while EasyJet allows customers to explore different destinations from a selected airport.

An interesting aspect related to customer experience and visualisation is cognitive load. Timileyin (2024) states that users have limited ability to process information when a website requires many actions or presents information unclearly. For both websites, easyJet needs to improve clarity about prices, which can reduce cognitive overload. Similarly, interfaces like Ryanair's, which display a lot of information on a single page, can also cause cognitive overload.

Another key aspect is how the website impacts the customer experience. Tomic et al. (2025) analysed factors that ensure good interface design quality. A good website should be easy to navigate, provide clear information, enable quick interactions, and have good visual organization. Ryanair assists customers in making choices by offering clear price information, whereas easyJet shows the route network but not prices, which makes it less informative.

In conclusion, the initial post highlighted the strengths and weaknesses of both sites. Adding insights on customer usability and experience can provide a deeper understanding of user satisfaction.
